                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC Furthermore, it may be contacted with a cell to reduce CD20 activity of CC the cell and treat a patient having a condition associated with the level CC of CD20. The treatment may further comprise the use of one or more CC thrapies. In particular, the CD20 targetting nucleic acid may be used to CC treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic CC leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell CC lymphoma (NCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, CC immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-CC targetting nucleic acid is used to cleave RNA of the NOGO-GEN gene in the CC presence of a divalent cation that is preferably Mg^2+. Furthermore, the CC nucleic acid may be contacted with a cell to reduce NOGO activity of the CC land treat a patient having a condition associated with the level of CC NOGO. The treatment may further comprise the use of one or more theration and treat a patient having a condition associated with the level of CC treat central nervous system (CNS) injury and cerebrovascular accident CC treat central nervous system (CNS) injury and cerebrovascular accident CC therapies. In particular, the NOGO-targetting nucleic acid may be used to CC treat central nervous system (CNS) injury and cerebrovascular accident CC Ark, stroke, Alzheimer's disease, dementia, multiple sclerosis (MS), Cemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parklinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob CC disease, which respond to the modulation of NOGO expression. The present XX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                       (CHOW/) CHOWRIRA B
                                                                                                                                                                                                                                            Chowrira
                                                                                                                                                                                                                                            뿅
```

The invention relates to a nucleic acid molecule which down regulates CC expression of a CD20 gene and a nucleic acid molecule which down considered to the contact of a neurite growth inhibitor gene (NGGO). The CC mucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a CD NAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an RNA motif), a G-cleaver (cleaving RNA with a NGN motif) processing an RNA with a NGN triplet), a zinzyme (cleaving RNA with a CD20 targetting RNA with a cell to reduce CD20 activity of the CD20 in the presence of a divalent having a condition associated with the level of CD20. The treatment may further comprise the use of one or more condition associated with the level of lymphoma (NGL), immunocytoma (NGL), small B-cell lymphocytic lymphoma, (NGL), immune thrombocytopaenia, and inflammatory arthropathy. The NGCO-targetting nucleic acid may be contacted with a cell to reduce NGGO gene in the contacted acid may be contacted with a cell to reduce NGGO activity of the NGCO-therapies. In particular, the NGGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CNA, stroke), Alzheimer's disease, dementia, multiple sclerosis (NS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (NLS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (NLS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (NLS), chemotherapy-induced neuropathy.

                                                                                                                                                                                                                                                                                                                  δ
                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides single-stranded oligonucleotides which can CC be used for the targeted alteration of genomic sequences, where the CC oligonucleotide has at least one mismatch compared with the genomic consumulation of particular, these sequences are directed at CC the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, Cyclin-dependent kinase inhibitor 2A (CDKN2A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus C (LDRA1), haemoglobin alpha locus 2 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, applipoprotein E (APCE), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presenilin-1 (PSEN1) and C presenilin-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, CC Alzheimer's disease, melanoma, adenomatous polyposis of the colon and CC various syndromes. The present sequence is one of the gene correcting coligonucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                        Query Match

```
The present invention provides single-stranded oligonucleotides which can compute the used for the targeted alteration of genomic sequences, where the coligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKN2A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MIH, MSH2, MSH6, apolipoprotein E (APOB), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGTI), amyloid precursor protein (APC), presenilin-1 (PSEN1) and cresenilin-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, such as cancer, adenosine deaminase deficiency, cystic fibrosis, alpha locus syndromes. The present sequence is one of the gene correcting coligonucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                             Oligonucleotide for targeted alterations of genetic sequences treating cystic fibrosis, comprises at least one mismatch and modification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Homo

                                                                                                                                                                                                                                                                                                      5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the coligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p33, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKN2A), APC, Factor V, Factor VII, Factor IX, haemoglobin alpha locus (CDKN2A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus (CDKN2A), APC, Factor VIII, Factor IX, haemoglobin alpha locus (CDKN2A), APC, Factor VIII, Factor III, MSH2, MSH6, apolipoprotein S (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGTI), amyloid precursor protein (APC), presenilin-1 (PSEM1) and presenilin-2 (PSEM2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting coligonucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                            oligonuclectide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKNJA), APC, Factor V, Factor VII, Factor IX, haemoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolipoprotein B (APCB), LDL receptor (LDLB), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presenilin-1 (PSEN1) and presenilin-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemoghilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous spolyposis of the colon and various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention

                                                                                                                                                                   cc expressing the proteins. The hGDMLP-1 proteins or polypeptides may be expressing the proteins. The hGDMLP-1 proteins or polypeptides may be cused as immunogens to raise antibodies that specifically recognise hGDMLP countries. As standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule coupture probes for surface-enhanced laser description ionisation, as the representation and in vaccines or for replacement therapy in hGDMLP-1 production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The conjunct of the sequences encoding hGDMLP-1 may be used for diagnosing a conjunct of the sequence sencoding hGDMLP-1 is localised to chromosome 22.

Cr and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

Cr he present sequence represents an oligomer used in the screening of the present invention. N.B.

Cr he sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO can be sequenced as a companion of the printed specification, but was obtained in electronic format directly from WIPO can be supposed to the printed specification.

                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1
                                                                                                                          Sequence

cc nucleic acids can be used as probes to detect, characterise and quantify cc hgbMLp-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hcbMLp-1 cc protein variants having desired phenotypic improvements, and for ce expressing the proteins. The hgbMLp-1 proteins or polypeptides may be comed as immunogens to raise antibodies that specifically recognise hcbMLP-1 proteins, as standards in assays used to determine the concentration cc and/or amount specifically of hcbMLp proteins, as specific biomolacule capture probes for surface-enhanced laser desorption ionisation, as the repeated of the protein and in vaccines or for replacement therapy. The concentration cc production, and in vaccines or for replacement therapy. The concentration alsorder associated with the expression of hcbMLP-1, in particular heart cand skeletal muscle disorders. hcbMLp-1 may be used for diagnosing a client sequence represents an oligomer used in the screening of the hcbMLP-1 sequence in the exemplification of the present invention. N.B. cr hcbMLp-1 sequence attacked in electronic format directly from WIFO at ftp. wipo.int/pub/published_pct_sequence

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynuclectide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        26-MAY-2000;

The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP comprovements, and for and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as therefore, and in vaccines or for replacement the concentration of the production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The colymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a colymucleotide sequence sencoding hGDMLP-1 may be used for diagnosing a colymucleotide sequence sencoding hGDMLP-1 is localised to chromosome 22. The present sequence with the expression of hGDMLP-1, in particular heart cand skeletal muscle disorders, hGDMLP-1 is localised to chromosome 22. The present sequence in the exemplification of the present invention. N.B. Chamber of the present invention. N.B. Chamber of the present invention, but was obtained in electronic format directly from MIPO at this patent did not form part of the printed content of the production of the present invention. New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of a
                                                                                                                                              Disclosure; SEQ ID NO
                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2002-179446/23.

```

CC protein 1 (hGDMLP-1). The protein and polymuclectide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 cc nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as capture probes for surface-enhanced laser description ionisation, as colution, and in vaccines or for replacement therapy. The proteins and in vaccines or for replacement therapy. The copynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a cliented with the expression of hGDMLP-1, in particular heart cand skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence in the exemplification of the present invention. N.B. Chester of the protein of the present invention. N.B. Chester of the protein of the present invention. N.B. Chester of the protein of the protein of the protein of the protein of the printed capture. The sequence data for this pattent did not form part of the printed capture in the samplification of the present invention. N.B. Chester of the printed capture of the printed capture of the printed capture. The sequence data for this pattent did not form part of the printed capture of the printed capture. The sequence data for this pattent did not form part of the printed capture. The sequence data for this pattent did not form part of the printed capture. BP; 3 A; 8 C; 4 G; 2 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be considered as immunogens to raise antibodies that specifically recognise hGDMLP CC used as immunogens to raise antibodies that specifically recognise hGDMLP CC and/or amount specifically of hGDMLP proteins, as specific ally of hGDMLP proteins, as specific biomolecule coapture probes for surface-enhanced laser description ionisation, as context in patients having specific biomolecule countries, and in vaccines or for replacement therapy. The collisation, and in vaccines or for replacement therapy. The collisation as collisorder associated with the expression of hGDMLP-1 in particular heart considered associated with the expression of hGDMLP-1 in particular heart considered the sequence in the expression of hGDMLP-1 in particular heart considered the present sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed consideration, but was obtained in electronic format directly from MIPO can fit the present did not form part of the printed consideration of the present invention. N.B. consideration of the present invention.

                                                                                                                                                                                                                                                  Human, genome-derived myosin-like protein 1, GDMLP-1; muscle; myosin; chromosome 22; gene therapy; vaccine; skeletal muscle disorder; amplicon; screening; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a human genome-derived myosin-like protein 1 (hgDMLP-1). The protein and polynucleotide sequences of hgDMLP-1 can be used in gene therapy and vaccine production. The hgDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hgDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hgDMLP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GL Y,

                                                                                                                                                                              The present invention describes a human genome-derived myosin-like CC protein 1 (hdDMLP-1). The protein and polynucleotide sequences of hdDMLP-1 CC I can be used in gene therapy and vaccine production. The hdDMLP-1 CC mucleic acids can be used as probes to detect, characterise and quantify CC hdDMLP-1 nucleic acids in sample, as amplification substrates, to provide initial substrates for the recombinant engineering of hdDMLP-1 CC protein variants having desired phenotypic improvements, and for cexpressing the proteins. The hdDMLP-1 proteins or polypeptides may be comed as immunogens to raise antibodies that specifically recognise hdDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hdDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as the capture probes for surface-enhanced laser description ionisation, as complement in pattients having specific deficiency in hdDMLP-1 capture probes for surface-enhanced laser description ionisation, as complement in pattients having specific deficiency in hdDMLP-1 composited with the expression of hdDMLP-1 in particular heart conditions and skeletal muscle disorders. hdDMLP-1 may be used for diagnosing a complement sequence represents an oligomer used in the screening of the present sequence in the expression of hdDMLP-1 in particular heart complement in patticular heart complement in the sequence in the screening of the present sequence data for this patent did not form part of the printed capture when into the millished not fermence.

                                                                                                                                                                                                                                                                                                                                   The present invention describes a human genome-derived myosin-like protein 1 (hgDMLP-1). The protein and polynucleotide sequences of hdDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as
                                                                                                                                                                               therapeutic supplement in patients having specific deficiency in hgDMLP-i production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hgDMLP-1 may be used for diagnosing a disorder associated with the expression of hgDMLP-1, in particular heart and skeletal muscle disorders. hgDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hgDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; hear muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to antisense compounds targetted to a nucleic acid encoding human receptor interacting protein (RIP)2 to inhibit its expression. Antisense compounds are used for treating diseases associated with RIP2 expression. They are also useful in antisense gene therapy. The present sequence is human RIP2 DNA specific PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 17 BP; 4 A; 4 C; 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotide that targets regions of a encoding human receptor interacting protein (RIP)2, for associated with RIP2 expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ABV78926
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   01-AUG-2001; 2001US-00920663.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to human testis expressed Patched like protein (HTPL, see ABV875) to ABV78762 and ABB98519 to ABB98520). HTPL CC has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL CC shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is CC important in regulating male germ cell development, and the HTPL gene was mapped to human chromesome logle 1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in CC therapy and manufacture of a medicament for treatment or prevention of CC such disorder associated with decreased expression or activity of human CC HTPL. Such disorders include disorders of testis, or adrenal, adult and CC foetal liver, bone marrow, brain, kidney, lung, placenta, prosstate, collanding the collon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an examinate from the invention.
                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                            The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL CC has two isoforms, with a few single base pair differences between the CC two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL CC shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is CC important in regulating male germ cell development, and the HTPL gene was CC import to human chromosome 10pl2.1. HTPL and its coding sequence are CC useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of CC therapy and manufacture of a medicament for treatment or prevention of CC such disorder associated with decreased expression or activity of human CC foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, CC skeletal muscle or colon function. HTPL proteins and nucleic acids are CC clinically useful diagnostic markers and potenial therapeutic agents for CC manned from the invention.

                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a nucleic acid molecule (I) which down regulates conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, convascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberows sclerosis, port-wine stains, Sturge convascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberows sclerosis, port-wine stains, Sturge convascung a patient having a condition associated with the level of ERG, convascung a patient having a condition associated with the level of ERG, convascung a patient having a condition associated with the level of ERG, conjunction with one or more therapies the use of one or more therapies conditions suitable for the treatment. Leukaemia or tumour cangiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or colling openess. By contacting the cell with (I). (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of Conjunction such as Mg2+. (I) is useful for reducing ERG activity and cell. (I) is useful for cleaving the coll to carion such as Mg2+. (I) is useful for diagnostic tool to carion such as Mg2+. (I) is useful for specifically contacting genes that share homology with ERG gene or ERG fusion genes. CRI,7354-ABK27219 represent nucleic acids, including antisense and conjunction of the invention

Novel polynuclectide which down regulates expression of Ets-related gene useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

Claim 4; Page 69; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates CC expression of an Ets-related gene (ERG). (I) is useful for treating CC conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, CC tumour angiogenesis, diabetic retinopathy, macular degeneration, verruca CC neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca CC vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge CC weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu CC syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, CC the treating sells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies CC under conditions suitable for the treatment. Leukaemia or tumour CC angiogenesis is treated by administering (I) to the patient in CC early by contacting the cell with (I). (I) is useful for reducing ERG activity in a CC early by contacting the cell with (I). (I) is useful for leukaemia or tumour CC early such as Mg2+. (I) is useful for reducing ERG activity in a ccell by contacting the cell with (I). (I) is useful for cleaving RNA of CC examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically CC examine genetic drift and mutations within RRG gene or ERG fusion genes. CRS targeting genes that share homology with ERG gene or ERG fusion genes. CRS targeting antienesse and CC englated PCR primers of the invention

                                                                                                                                                                                                                                                                                                                                     Consider the specification, a sequence containing at least 15 consecutive controlles from the 17 mer sequence with, after optimal considered that least 80 % identity to the 17 mer sequence, a sequence that conditions, or the complement confidered to them under highly stringent conditions, or the complement conflictions, or the complement conflictions of the invention are useful as probes and primers for detecting, confidentifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for component of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell containing the sparastion, specifically cancer but also Alzheimer's disease and confidence to smalles is useful for diagnosis and/or prognosis of these confidence is a seeful for diagnosis and/or prognosis of these confidence is a seeful for diagnosis and/or prognosis of these confidence is a seeful for confidence and antibodies are useful as components of protein confidence. The mucleic acid sequences of the invention can be used in gene confidence in the polypeptide and antibodies are useful as components of protein confidence in the polypeptide and antibodies are useful as components of protein confidence in the polypeptide and antibodies are useful as components of protein confidence in the polypeptide and antibodies are useful as components of protein confidence in the polypeptide and antibodies are useful as components of protein confidence in the polypeptide and antibodies are useful as components of protein confidence in the polypeptide confidence represents a tumour suppression confidence in the polypeptide confidence of the invention can

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ55389 - ABZ65216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66585 represent substrate/target sequences for the human riboxymes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV; anti-rheumatic; cancer; AIDS; ss.
                                                                                                                                                                                                                                                                                                 Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                           WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents an antisense nucleotide sequence targeting human smad2. Smad2 is also known as MADH2, MADR2, hMAD2 and JVL8-1, and is a member of a subgroup of Smad family transcription factors which are cytosolic proteins regulated by transforming growth factor-beta (TGF-beta) and activins. Smads exist as monomers in unstimulated cells as home or heterodimerise and translocate to the nucleus and activate target gene transcription upon ligand binding. The Smad2 gene is located on chromosome 18q21. The invention relates to antisense compounds (see AAA10548-A10587) targeted to the Smad2 nucleotide sequence. The antisense aligonucleotide sequences inhibit Smad2 surression by hybridising to DNA or RNA. The antisense nucleotides are used to treat or prevent diseases associated with expression of Smad2, e.g. infection, inflammation and tumours. The oligonucleotides can also be used as diagnostic or research

CC encoding aminopeptidase P (KPNEP2), bradykinin receptor B1 (BDKRB1), C1 esterase inhibitor (C1NH), kalikrein CC (achykinin receptor B2 (BDKRB2), angiotensin converting enzyme C2 (ACE2) or protease inhibitor 4 (P14), comprising at least one CC polymorphic position as provided in the detailed summary of single CC uncleotide polymorphisms comprising additional 5 and 3 flanking genomic CC sequence; (2) analysing (M1) at least one nucleic acid sample comprising comprising comprising comprising comprising constructing (M2) encoding a protein selected from the group above; (3) constructing (M2) an individual at least two nucleic acid sample comprising comprising grouping at least two nucleic acids (a) identifying (M3) an individual at risk of developing a disorder componesses one or more polymorphic positions in a gene comprises one or more polymorphic positions within a gene encoding a protein selected from the group above; (3) constructing (M2) comprises one or more polymorphic positions within a gene encoding a comprise one or more polymorphic positions within a gene encoding a comprise one or more polymorphic positions within a gene encoding a comprise one or more polymorphic positions within a gene encoding a comprise one position with a known data set. The genes, (M1, M2, M3 and M4) and individual comprising obtaining a nucleic acid sample, determining the construction within a gene encoding a construction within a gene encoding a nucleic acid sample, determining the construction within a gene encoding a nucleic acid sample, determining the construction within a gene encoding a nucleic acid sample, determining at least one polymorphic position, and comparing at least one p
                                         hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic obstructive pulmonary disease (COPD) and enterocolitis (many other diseases and disorders are listed in the specification). The polynuclectides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is included in the sequence listing but is not referred to anywhere else in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     04-DEC-2000; 2000US-0251015P.

             CC encoding aminopeptidase P (XPNEP2); bradykinin receptor B1 (EDRKB1), C1 catchykinin receptor B1 (EDRKB1), C2 catchykinin receptor B2 (EDRKB2), angiotensin converting enzyme C2 (ACE2) or protease inhibitor 4 (P14), comprising at least one C2 (ACE2) or protease inhibitor 4 (P14), comprising at least one C2 (ACE2) or protease inhibitor 4 (P14), comprising at least one C3 (Polymorphic position. Also included are (1) a probe that hybridises to a C4 polymorphic position as provided in the detailed summary of single C5 (P14) (P14), comprising additional 5 and 3 flanking genomic C6 sequence; (2) analysing (M1) at least one nucleic acid sample comprising C7 cobtaining the sequence at one or more individuals and determining the C7 catching a protein selected from the group above; (3) constructing (M2) (P14) and protein games comprising grouping at least two nucleic acids (4) identifying (M3) an individual at risk of developing a disorder C6 (P14) 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          tachykinin receptor B1; TACR1; C1 esterase inhibitor; C1NH; kallikrein KLK1; bradykinin receptor B2; BDKRB2; gene therapy; angiotensin converting enzyme 2; ACB2; protease inhibitor 4; PI4; polymorphism; haemangioma; tumour; sarcoma; Crohn's disease; trachoma; polymorphism; haemangioma; tumour; sarcoma; Crohn's disease; trachoma; cardiovascular disease; angina pectoris; hypertension; heart failure; myocardial infarction; ventricular hypertrophy; vascular disease; angioedaema; aneurysm; embolism; thrombosis; coronary artrophy; vascular disease; angioedaema; arteriosclerosis; atherosclerosis; hypersensitivity; sepsis; autoimmune disease; inflammatory arthritis; cancer; wound; viral infection; bacterial infection; fungal infection; COPD;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                     The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. Succeed to the maximum in the specified discrimination Nos. It array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. Succeed to the specified discrimination Nos. (are mixed respectively in each wells of longitudinal and larger and array and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic obstructive pulmonary disease (COPD) and enterocolitis (many other diseases and disorders are listed in the specification). The polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is included in the sequence listing but is not referred to anywhere else in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         preventing various disorders such as angioedaema and diseases withvolve angiogenesis like haemangiomas, tumours, sarcomas, Crohi disease, trachomas, and cardiovascular diseases like angina peci hypertension, heart failure, myocardial infarction, ventricular hypertrophy, vascular diseases, aneurysm, embolism, thrombosis, artery disease, arteriosclerosis and/or atherosclerosis, and
and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) sare detected from the amplified products; (h) the clones in the materials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 18 BP; 1 A; 9 C; 2 G; 6 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 δ
The invention relates to a method for inhibiting viral replication in a cell or animal, where a heat-shock protein (HSP) is required for replication, comprises administering an inhibitor of the heat shock protein. Also included are a kit for the process comprising the protein and instructions; an isolated nucleic acid that is complementary (antisense) to a sequence that encodes the HSP; a vector containing the antisense molecule; a non-human transgenic mammal containing the antisense molecule; a method for inhibiting viral replication in a cell by administering the antisense molecule; or its argument; a non-human transgenic mammal containing isolated nucleic acid that encodes a viral particle u-binding protein (UBP) or its derivative or fragment; a non-human transgenic mammal containing isolated nucleic acid that encodes an inhibitor of HSP-dependent viral replication; a method for inhibiting viral replication in a cell by administering the inhibitor encoding nucleic acid; and a method for identifying compounds that inhibit HSP-dependent viral replication. The method is used to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL4257 to ABL45322 represent PCR primers for human chromosome 1p36-35 DNA, and ABL45323 to ABL45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Yeast; ss; PCR; heat shock protein 40; J domain; anti-HTV; viruoide; cytostatic; hepatotropic; antiinflammatory; transgenic; HSP; primer; u-binding protein; UBP; chicken embryo orphan adenovirus infection; San Nombre hantavirus infection; human immune deficiency virus infection; ervical cancer; hepatitis; measles; HIS biosynthetic gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              15-JUL-2002

Also: (i) inhibition of HSP function is used to identify agents that inhibit HSP-dependent replication (potential therapeutic agents); (ii) expression of HSP inhibitors in transgenic animals is used to produce virus-resistant strains of livestock; and ((ii)) recombinant cells expressing nucleic acid that encodes the inhibitor are useful therapeutically and for studying HSP signalling pathways. The present sequence a PCR primer used to detect a deletion of the Yeast UBP gene in a yeast strain to be used for expression of UBP constructs used for assaying the inhibition of human immunodeficiency virus replication by UBP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Synthetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to antisense compounds targetted to a nucleic acid comblecule encoding human inhibitor-kappa B-R (also known as I-kappaBR, IXBR, I-kappa-B-related, ikappabr, nuclear factor of kappa light polypeptides gene enhancer in B-cells inhibitor-like 2 and NFKBIL2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with the expression of increased cytokine expression, or a result of infection (e.g. bacterial, cyiral or parasitic). They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in distinguishing between C functions of various members of a biological pathway. They are also cuseful in antisense therapy. The present sequence is an oligonucleotide or targetted to human inhibitor-kappa B-R DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

The invention relates to antisense compounds targetted to a nucleic acid comblecule encoding human inhibitor-kappa B-R (also known as I-kappaBR, CC IKER, I-kappa-B-related, ikappab r, nuclear factor of kappa light color polypeptides gene enhancer in B-cells inhibitor-like 2 and NFKBIL2) to climbibit its expression. Antisense compounds of the invention are useful cfor treating diseases or conditions associated with the expression of inhibitor-kappa B-R such as a heightened immune response involving concreased cytokine expression, or a result of infection (e.g. bacterial, corrected cytokine expression, or a result of infection (e.g. bacterial, corrected cytokine expression) or a result of infection (e.g. bacterial, corrected cytokine expression) or a result of infection of the corrected corrected cytokine expression or a result of infection of the corrected corrected cytokine expression or delay infection, inflammation or tumour corrected corrected cytokine expression of a biological pathway. They are also cuseful in antisense therapy. The present sequence is an oligonucleotide cargetted to human inhibitor-kappa B-R DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense oligonucleotides targeted to nucleic acids encoding inhibitor-kappa B-R, useful for diagnosing or treating diseases associated with expression of inhibitor-kappa B-R, e.g., a heightened immune response or infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC skin disorders. The method comprises contacting the skin with an CC antisense oligonuclectide, (for Insulin-like Growth Factor [GF]-1 CC receptor, [GF binding protein [IGFRP]-2 or IGFRP]), which is capable of cinhibiting or reducing growth factor mediated cell proliferation, CC infilammation and/or other disorders. The present sequence is an CC oligonuclectide which can be used to design the antisense CC oligonuclectide of the present invention (see AAF45151 and AAF45153-CC prolifers, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, CC inthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, CC proplasias, scleroderma, warte, benign growths, cancers of the Skin, a CC proplasias, scleroderma, warte, benign growths, cancers of the Skin, a CC prain or skin, growth factor-mediated malignancies, other sclerotic cdisease, kidney disease, hyperproliferation of the inside of blood CC vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

cc skin disorders. The method comprises contacting the effects of cantisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 CC receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of cinhibiting or reducing growth factor mediated cell proliferation, CC inflammation and/or other disorders. The present sequence is an CC oligonucleotide which can be used to design the antisense CC oligonucleotides of the present invention (see AAF45151 and AAF45153-CC (CC F45161). The method is useful for ameliorating the effects of psoriasis, cc inchiposis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, CC neoplasias, scleroderma, warts, benign growths, cancers of the skin, and continuous condition of the retina, cc hyperneovascular condition such as a neovascular condition of the retina, cc brain or skin, growth factor-mediated malignancies, other sclerotic cc vessels or any other hyperplasia

```

The present Example 6; Page

invention relates to a method

thod for ameliorating the effects contacting the skin with an

O.

method

comprises

201pp;

English

disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-01igonucleotides of the present invention (see AAF45151 and AAF45153-1745161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8301/c

The present invention relates to a method for ameliorating the effect skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an

of f

oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psorias ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosi

The present invention relates to a method for ameliorating the effect skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense

the effects

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 15

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 hypernovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide of the present invention (see ARP45151 and ARP45153-P45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhosa, kelodids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense therapy, antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular; condition; hyperplasia; kidney disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     hyperneovascular condineovascular condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          30-MAR-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAF52823 standard; DNA; 15

                                                                                                                                                                                                                       The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcriptio factor gene, IRF-2 and/or the CATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production erythropoietin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAF01936;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAF01936
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor prointerferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hammerhead ribozyme substrate #231.
                                                                                                                                                      Sequence 17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            12-APR-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         11-APR-2000; 2000WO-US009721.

                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-IF-1, the GAIA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ribozyme; erythropoietin; interferon alpha; ss.

Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a nucleic acid molecule which down regulates (expression of a CD20 gene and a nucleic acid molecule which down regulates (expression of a neurite growth inhibitor gene (NOGO). The CC public acids may be enzymatic nucleic acids (e.g. a ribozyme or a CC DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motti); a G-cleaver (cleaving RNA with a NYN motti) processing an NCH motti). The CD20-targetting nucleic acid is used to cleaving RNA with a YGY motti). The CD20-targetting nucleic acid is preferably Mg^2+.

CC possessing an NCH motti) and NGN triplet), a zinzyme (cleaving RNA with a YGY motti). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2+.

CC processing and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more thoughtin's lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-cc leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocyrcoma (IMC), small B-cell lymphocyric lymphoma, cc immune thrombocyrcoparia, and inflammatory arthropathy. The NOGO-crested with a cell to reduce NGO gene in the ccl arigetting nucleic acid is used to cleave RNA of the NGO gene in the ccl acid may be contacted with a cell to reduce NGO activity of the CC largetting nucleic acid may be used to cleave RNA to the NGO activity of the CC cell and treat a patient having a condition associated with the level of therapies. In particular, the NGO-targetting nucleic acid may be used to cleave contacted with a cell to reduce NGO activity of the coll and treat a patient having a condition associated with the level of CC patiency induced neuropathy, amyotrophic lateral sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS), chemotherapy induced to the modulation of NGO expression. DNAzyme molecule

```
The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down conclusive states expression of a neurite growth inhibitor gene (NOGO). The conclusion and the enzymetic nucleic acids (e.g. a ribozyme or a condition and the enzymetic nucleic acids (e.g. a ribozyme or a condition and the enzymetic nucleic acids (e.g. a ribozyme or a condition and the enzymetic nucleic acid cleaving a new NNA molecule consessing an NCH motif), a G-cleaver (cleaving RNA with a NNA motif) proceed an amberzyme (cleaving RNA with a NNA triplet), a zinzyme (cleaving RNA with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therepies. In particular, the CD20 targetting nucleic acid may be used to cleave RNA condition associated with the level conformation (NCL), immunocytoma (NMC), small B-cell lymphocytic lymphoma, leukaemia, Hr (human immunodeficiency virus) associated NHL, lymphocytic conformation associated with the cell cardid may be contacted with a cell to reduce NOGO gene in the presence of a divalent cation that is preferably Mg^2+. Furthermore, the cell individual new particular, the NOGO-cent cardid with the level of conformation associated with the level of conformation acid may be contacted with a cell to reduce NOGO activity of the cell and treat a patient having a condition associated with the level of conformation and conformation and condition associated with th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               11-FEB-2000;

XX Claim
The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down CC regulates expression of a neurite growth inhibitor gene (NGGO). The CC nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a CC DNRzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule CC possessing an NCH motif), a G-cleaver (cleaving RNA with a NYM motif) pr con amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20 targetting nucleic acid is used to cleave RNA CC with a YGY motif). The CD20 targetting nucleic acid is used to cleave RNA CC price of a divalent cation that is preferably Mg^2+. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular NHI, lymphoma, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular NHI, mantle-cell lymphoma (MCI), immunocytoma (IMC), small B-cell lymphocytic lymphoma, in the condition and inflammatory arthropathy. The NGGO-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              11-FEB-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease. dementia multiple acid...
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; genome-derived myosin-like protein 1; GDMLP-1; muscle; myosin; chromosome 22; gene therapy; vaccine; skeletal muscle disorder; amplicon; screening; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS) chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS). Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The preser sequence is an amberzyme molecule of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC The present invention describes a human genome-derived myosin-like CC protein 1 (hGDMLP-1). The protein and polynuclectide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 cc nucleic acids can be used as probes to detect, characterise and quantify CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to cc provide initial substrates for the recombinant engineering of hGDMLP-1 cc protein variants having desired phenotypic improvements, and for cc expressing the proteins. The hGDMLP-1 proteins or polypeptides may be closed as immunogens to raise antibodies that specifically recognise hGDMLP consider a second proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser descrption ionisation, as continuously the proteins and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The collision of disorder associated with the expression of hGDMLP-1, in particular heart can disorder associated with the expression of hGDMLP-1, in particular heart can disorder associated with the expression of hGDMLP-1, in particular heart can be guence disorders. hGDMLP-1 is localised to chromosome 2.

The present sequence in the exemplification of the present invention. N.B. complete data for this patent did not form part of the printed continuous contraction, but was obtained in electronic format directly from MIPO cat figure in the screening of the contraction of the printed contraction of the printed contraction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The present invention describes a human genome-derived myosin-like CC protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 cC nucleic acids can be used as probes to detect, characterise and quantify comproved initial substrates for the recombinant engineering of hGDMLP-1 cC protein variants having desired phenotypic improvements, and for cexpressing the proteins. The hGDMLP-1 proteins or polypeptides may be compressed in the proteins. The hGDMLP-1 proteins or polypeptides may be compressed in the proteins as standards in assays used to determine the concentration capture probes for surface-enhanced laser described initiation, as capture probes for surface-enhanced laser described energy in hGDMLP-1 capture probes for surface-enhanced laser described energy in hGDMLP-1 composition, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a cdisorder associated with the expression of hGDMLP-1, in particular heart cand skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence in the exemplification of the present invention. N.B. The present sequence in the exemplification of the present invention. N.B. ChGDMLP-1 sequence data for this pattent did not form part of the printed composition, but was obtained in electronic format directly from WIPO at figure 1 and 1 and 1 and 1 particular sequence control of the printed contr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure; SEQ ID NO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a nucleic acid molecule (I) which down regulates coxpression of an Ets-related gene (ERG), (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour anglogenesis, diabetto retinopathy, macular degeneration, convascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or cell, by contacting the cell with (I). (I) is useful for reducing ERG activity in a cell, by contacting (I) with RNA, in the presence of a divalent cation such as my2+. (I) is useful for reducing ERG activity in a cell, so the expression of ERG, and as diagnostic tool to the presence of ERG RNA in a cell. (I) is useful for specifically cation such as material such as a diagnostic tool to the presence of ERG RNA in a cell. (I) is useful for specifically cation such as mare homology with ERG gene or ERG fusion genes. CRI and mutations within ERG gene or ERG fusion genes. CRI activity in a cell caids, including antisense and centry and contacting caids and cells or to detect the presence of a caid molecules which regulate expression of ERG, and cells or to detect the presence of activity in a cell caids, including antisense and cell cells or to detect the presence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a nucleic acid molecule (I) which down regulates conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, convolutions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, convolutions, successive port-wine stains, Sturge weber syndrome, Kippel-Trenaunay-Weber syndrome, Generation, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, Leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, the treatment. The method comprises the use of one or more therapies of the treatment in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or cell, by contacting the cell with (I). (I) is useful for reducing ERG activity in a cell, by contacting the cell with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for reducing ERG activity in a cell, in its useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and cell seases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically targeting genes that share homology with ERG gene or ERG fusion genes. ABKI7354-ABK2719 represent nucleic acids, including antisense and cellated PCR primers of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to the isolation of 6327 nucleotide sequences, a fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tunour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Alb) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure; Page 386; 771pp; French.

A cap sequence increases nuclease resistance of the oligonucleotide and also increases cell penetration. The present sequence is that of a preferred oligonucleotide, directed against HSV-1 sequences, which can be capped
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Oligo:nucleotide(s) with series of G residues at at least one end have increased stability against nuclease and cell penetration, - are particanti:sense sequences for treating and diagnosing cancer, viral diseases
